

# IndoFoodle Development Framework

IndoFoodle is a browser-based daily Indonesian food guessing game inspired by Scrandle. The project currently runs on a lightweight HTML/CSS/JavaScript architecture with locally stored JSON data and images. The goal is to evolve it from a polished prototype into a replayable, shareable, scalable social web game.

## 1. Current Architecture

- Static frontend stack (HTML/CSS/JavaScript)
  - foods.json as the food database
  - Seeded daily randomized matchups
  - Practice mode with random pair generation
  - Warm-up vote system for daily mode
  - Fade transitions and percentage reveal animations
  - Responsive mobile-first card layout
  - Local image hosting under images/foods/
- 

## 2. Core Gameplay Loop

- Player opens IndoFoodle
  - Daily matchup seed generated from current date
  - Warm-up vote shown before daily game
  - Player answers majority-choice food matchups
  - Percentage reveal shown after selection
  - Score dots update after every round
  - Final result and share text generated
  - Daily progress stored in localStorage
- 

## 3. Immediate Refactor Plan

- Split script.js into multiple logical files
- Move utility/data functions into game-data.js
- Keep gameplay flow in script.js
- Reduce future debugging complexity

- Prepare codebase for backend integration
- 

## 4. Planned Feature Roadmap

- Daily streak system
  - Statistics and profile tracking
  - Shareable end-game grid like Wordle/Scrandle
  - Rare pick detection (low percentage choices)
  - Difficulty balancing for matchups
  - Regional matchup categories
  - Community-generated food voting
  - Sound effects and stronger UI feedback
- 

## 5. Backend Evolution Plan

- Current state uses generated seeded percentages
  - Future state should use real community vote data
  - Potential backend options: Supabase, Firebase, Cloudflare Workers
  - Store warm-up and gameplay votes
  - Generate live matchup percentages from database
  - Add anti-spam and daily vote protection
- 

## 6. Deployment Strategy

- Recommended platform: Cloudflare Pages
  - GitHub-based deployment pipeline
  - Global CDN caching for performance
  - Automatic SSL and custom domain support
  - Potential future usage of Cloudflare Workers + D1/KV
- 

## 7. UI/UX Improvement Direction

- Improve typography hierarchy
  - Increase visual identity and polish
  - Add subtle shadows and depth
  - Improve end-game presentation
  - Add preload/lazy image optimization
  - Strengthen transitions and motion design
- 

## 8. Codebase Principles

- Clear function naming
  - Comment blocks for every major system
  - Avoid hidden magic logic
  - Prefer modular growth over giant files
  - Maintain readable beginner-friendly structure
  - 'BRUH it up' means full replacement file delivery
- 

## 9. Long-Term Vision

- Become a replayable Indonesian culture web game
  - Potential TikTok/X viral sharing loop
  - Daily-return player behavior
  - Expandable into regional food packs or seasonal events
  - Potential multiplayer/community leaderboard systems
- 

Current project status: IndoFoodle has already crossed the hardest stage of development — the core gameplay loop exists and functions consistently. Future work should focus on replayability, data persistence, social sharing, and visual polish rather than rebuilding the foundation.
